Program Analysis

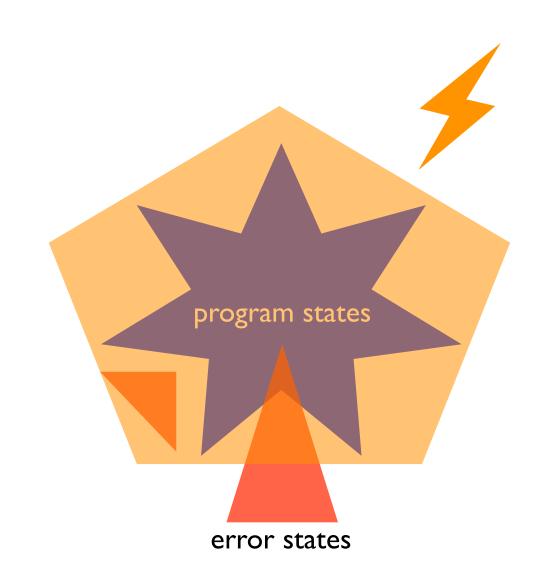

12. Selective X-sensitivity

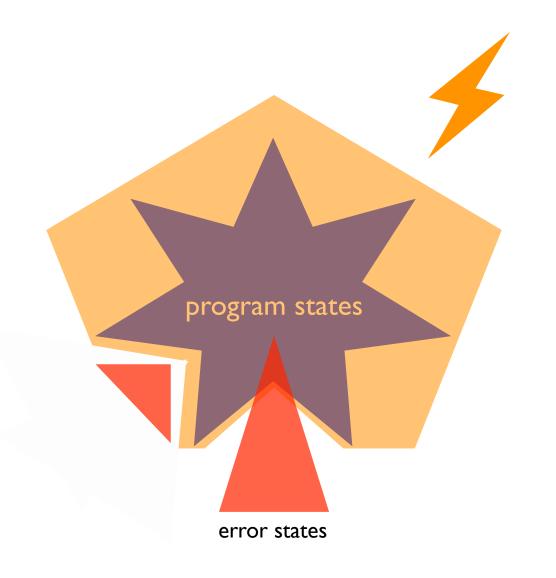

Kihong Heo

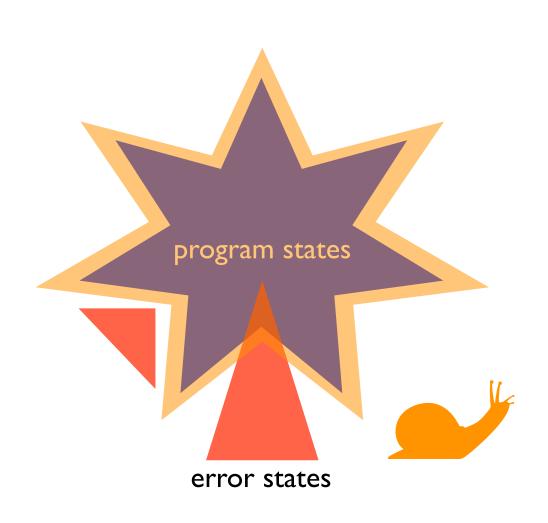

Cost-Accuracy Balance

- How to strike a balance between cost and accuracy?
- How to find a minimal abstraction to produce the best result?

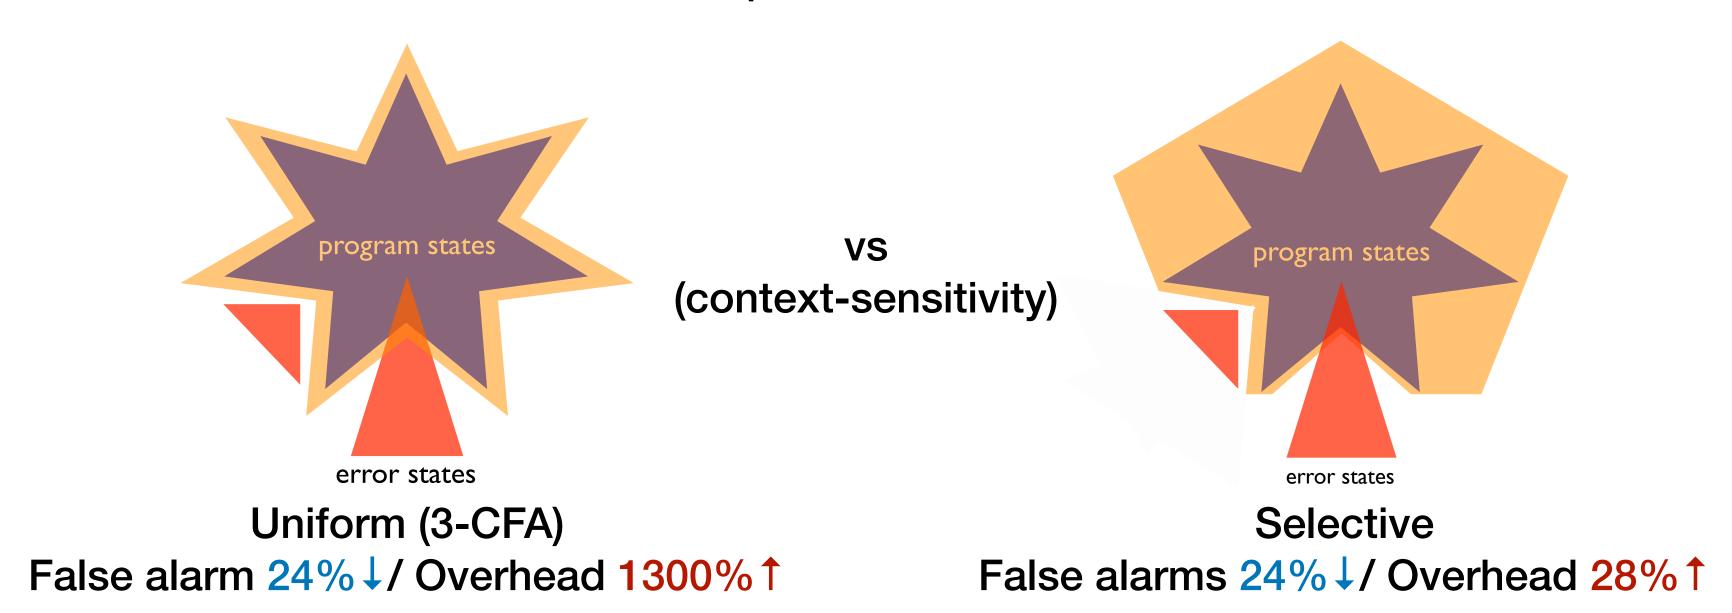

Selective X-Sensitivity

- Selectively apply a precision-improving technique X-sensitivity
 - only when/where it matters
 - X: context, flow, variable relationship, etc

*Oh et al. Selective Context-Sensitivity Guided by Impact Pre-analysis, PLDI'14

Suppose an analysis with the interval domain

```
int h(n) { return n; }

void f(s) {
1:    p = h(s);
    assert(p > 1); // Q1: always true
2:    q = h(input());
    assert(q > 1); // Q2: not always true
}

3: void g() { f(8); }

void main(){
4:    f(4);
5:    g();
6:    g();
}
```

Context-insensitive analysis

```
int h(n) { return n; }
                             [-00, +00]
                                            cannot prove
  void f(s) {
                                                                      {4}
    p = h(s);
     assert(p > 1):// Q1: always true
     q = h(input());
                                                            main
     assert(q > 1); // Q2: not always true
3: void g() { f(8); }
  void main(){
     f(4);
```

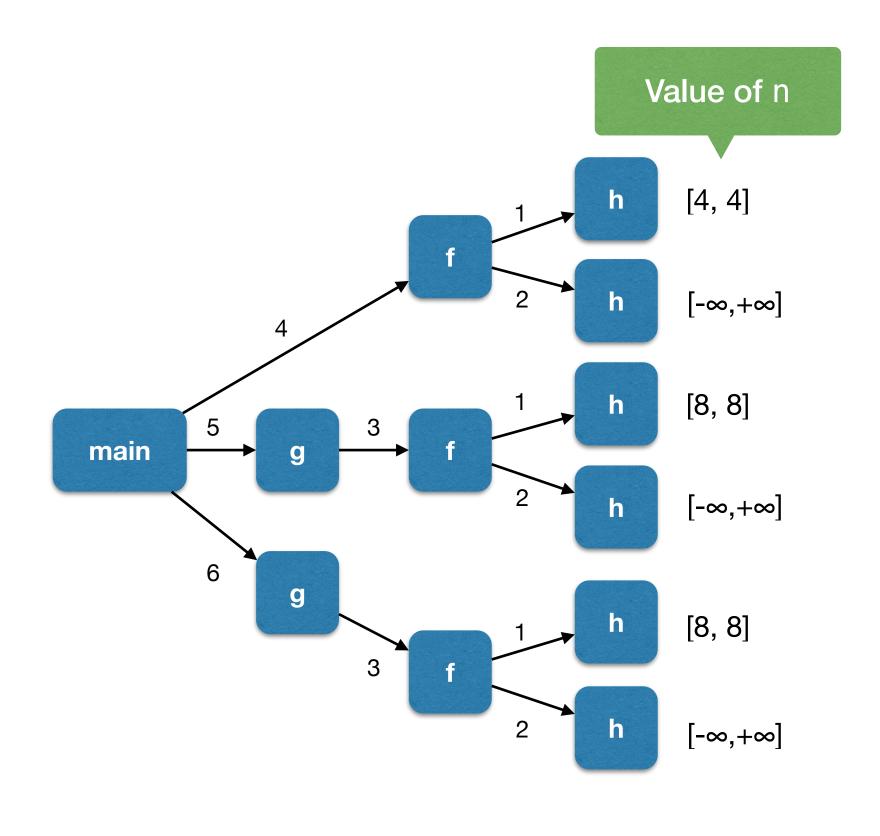

Uniformly context-sensitive analysis (3-CFA)

```
int h(n) { return n; }

void f(s) {
1:    p = h(s);
    assert(p > 1); // Q1: always true
2:    q = h(input());
    assert(q > 1); // Q2: not always true
}

3: void g() { f(8); }

void main(){
4:    f(4);
5:    g();
6:    g();
}
```

Uniformly context-sensitive analysis (3-CFA)

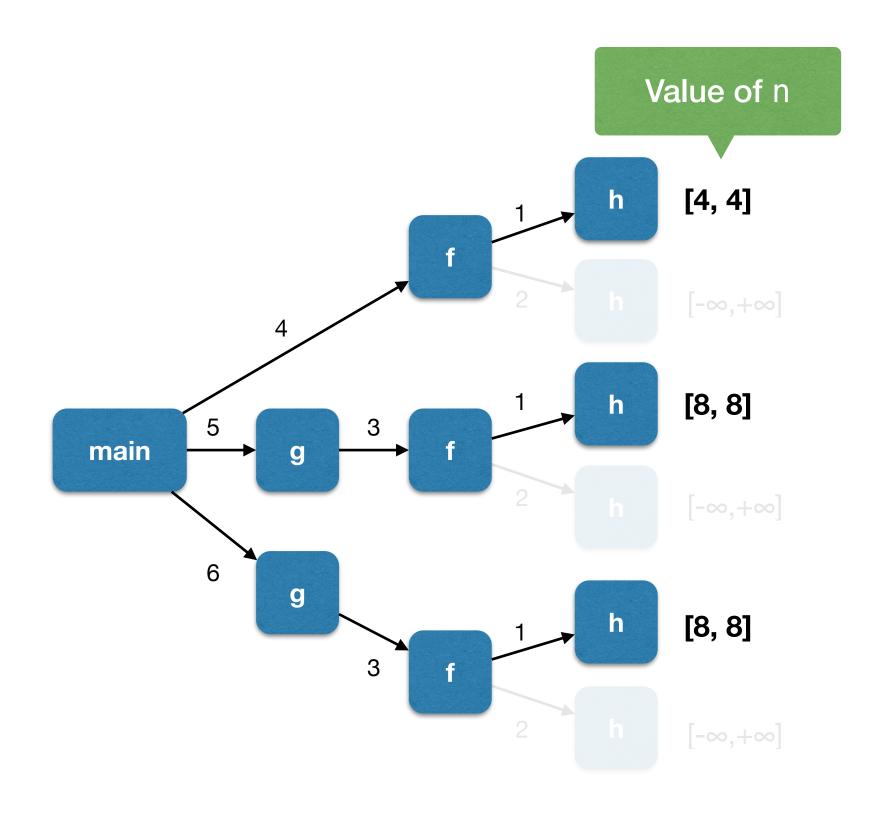

```
int h(n) { return n; }

void f(s) {
    p = h(s);
    assert(p > 1); // Q1: always true

2:    q = h(input());
    assert(q > 1); // Q2: not always true
}

3: void g() { f(8); }

void main(){
    f(4);
    g();
    g();
}
```

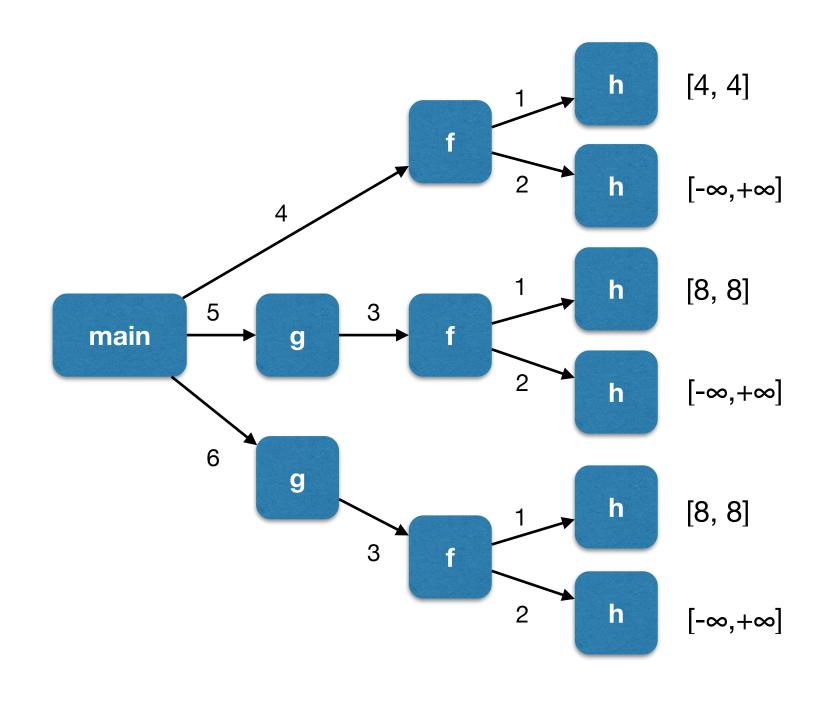

Problem of uniformly sensitive analysis

```
int h(n) { return n; }

void f(s) {
1:    p = h(s);
    assert(p > 1); // Q1: always true
2:    q = h(input());
    assert(q > 1); // Q2: not always true
}

3: void g() { f(8); }

void main(){
4:    f(4);
5:    g();
6:    g();
}
```

Problem of uniformly sensitive analysis 1: useless sensitivity

```
int h(n) { return n; }

void f(s) {

p = h(s);
    assert(p > 1); // Q1: always true

q = h(input());
    assert(q > 1); // Q2: not always true
}

3: void g() { f(8); }

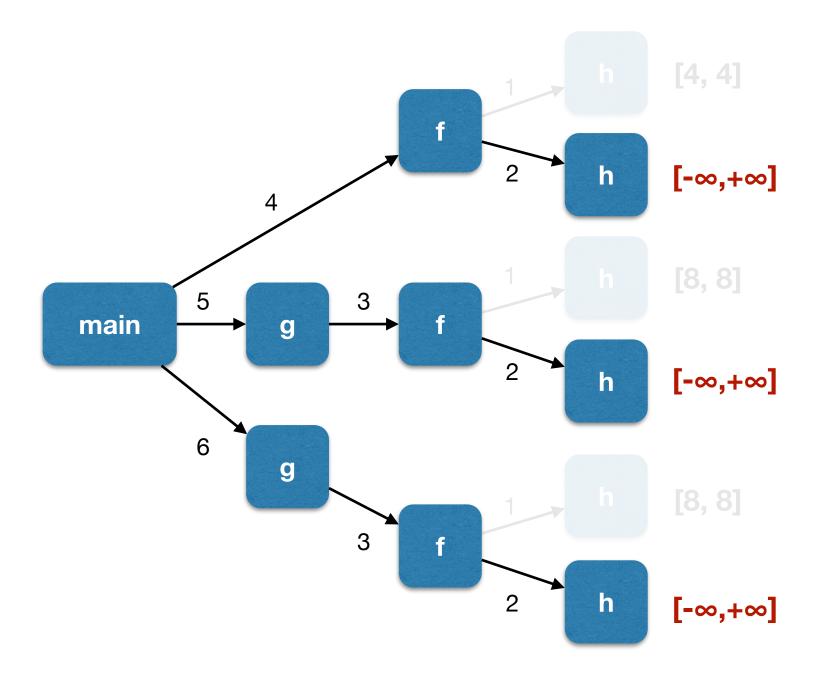

void main(){

f(4);

g();

g();

}
```

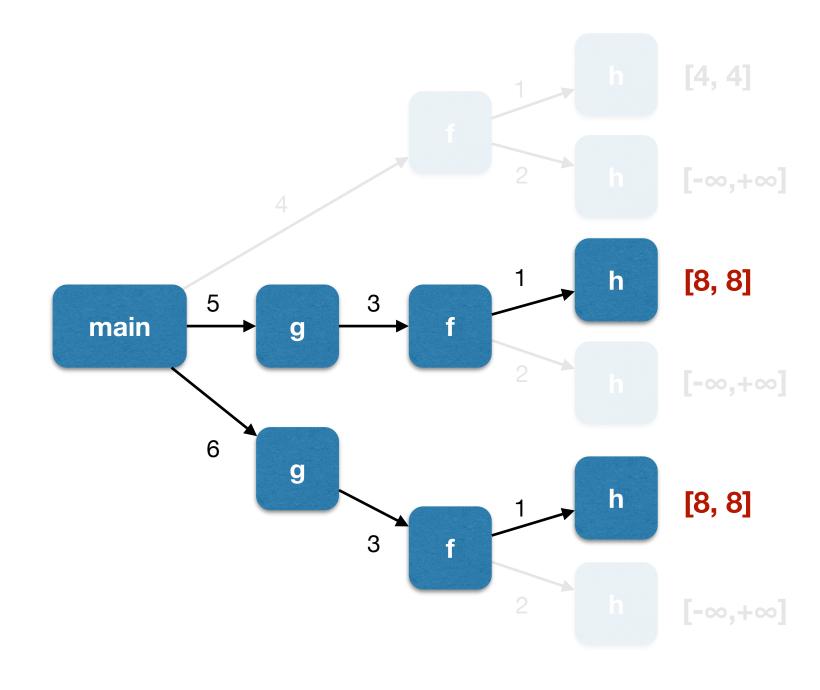

Problem of uniformly sensitive analysis 2: too much sensitivity

```
int h(n) { return n; }

void f(s) {
1:    p = h(s);
    assert(p > 1); // Q1: always true
2:    q = h(input());
    assert(q > 1); // Q2: not always true
}

3: void g() { f(8); }

void main(){
4:    f(4):
5:    g();
6:    g();
}
```

• Solution: selective context-sensitive analysis

```
int h(n) { return n; }

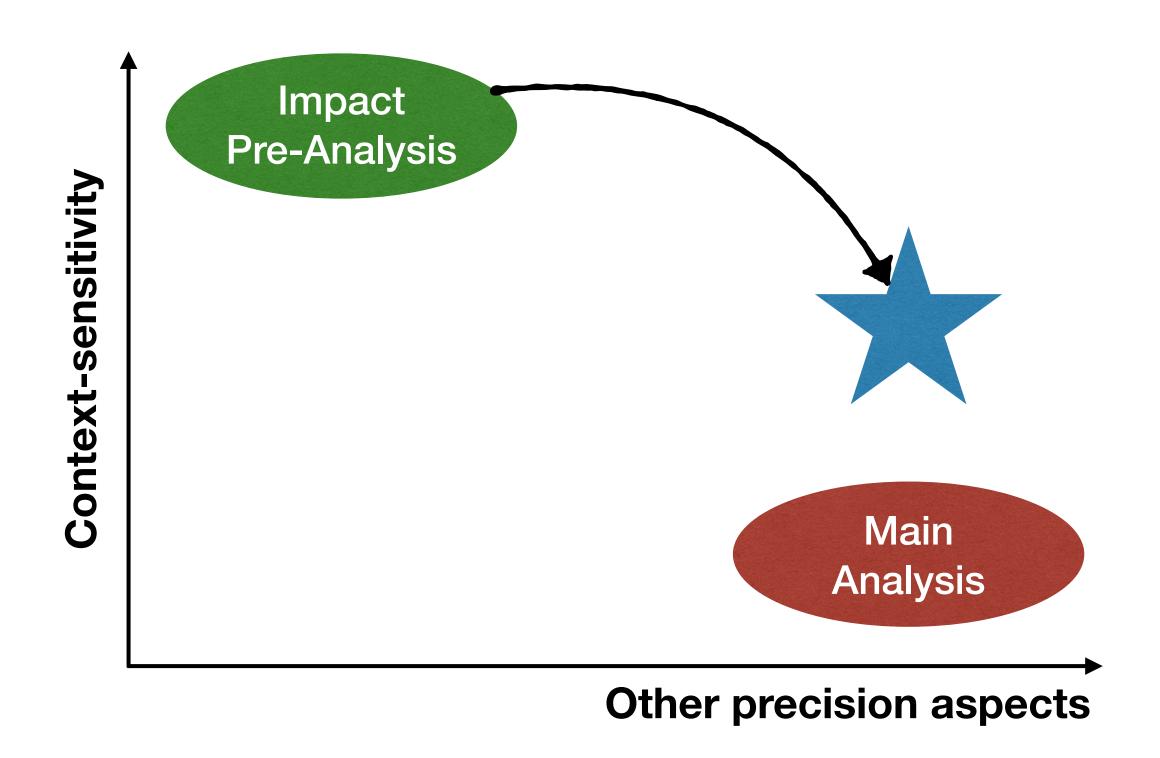

void f(s) {
1:    p = h(s);
    assert(p > 1); // Q1: always true
2:    q = h(input());
    assert(q > 1); // Q2: not always true
}

3: void g() { f(8); }

void main(){
4:    f(4);
5:    g();
6:    g();
6:    g();
}
Q: How to infer this selective context-sensitivity?
```

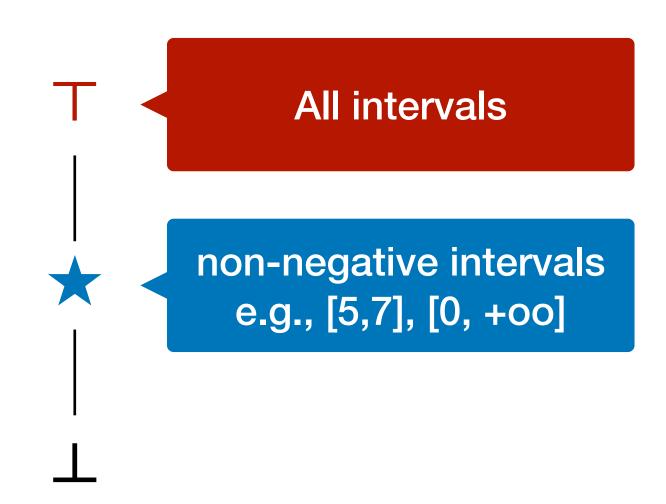

Key Idea: Impact Pre-Analysis

- Estimate the impact of X-sensitivity on main analysis
 - Fully X-sensitive, but approximated in other precision aspects

Design of Impact Pre-Analysis

- Main analysis: context-insensitive + interval domain
- Impact pre-analysis: fully context-sensitive + approximated interval domain

$$\wp(\mathbb{Z}^{\sharp}) \stackrel{\gamma}{\longleftrightarrow} \{\bot, \bigstar, \top\}$$

Running Impact Pre-Analysis

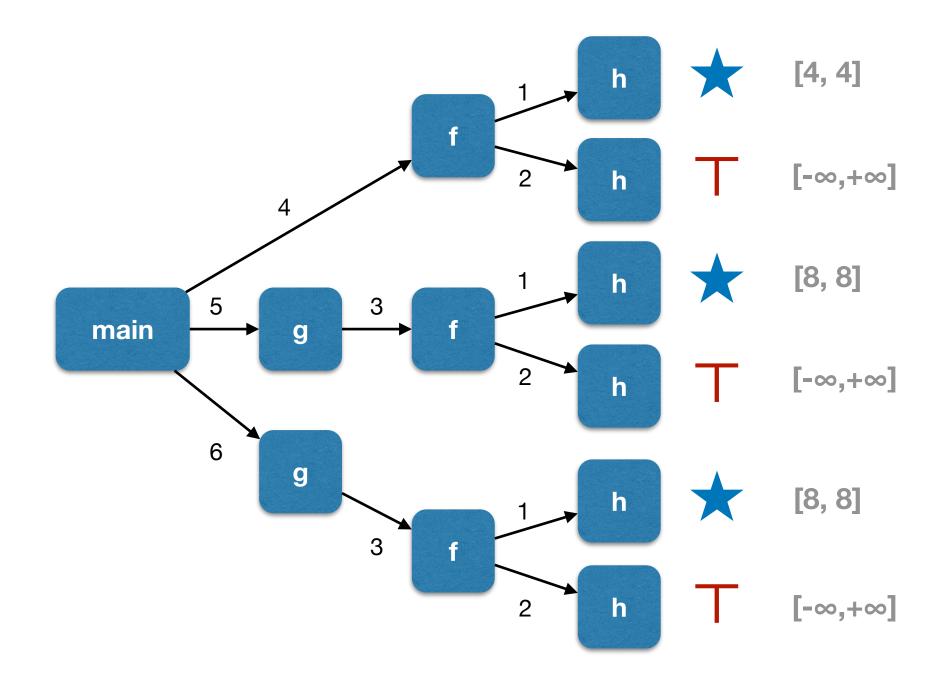

• Impact pre-analysis: fully context-sensitive + approximated interval domain

```
int h(n) { return n; }

void f(s) {
1:    p = h(s);
    assert(p > 1); // Q1: always true
2:    q = h(input());
    assert(q > 1); // Q2: not always true
}

3: void g() { f(8); }

void main(){
4:    f(4);
5:    g();
6:    g();
}
```

Constructing Selective Sensitivity

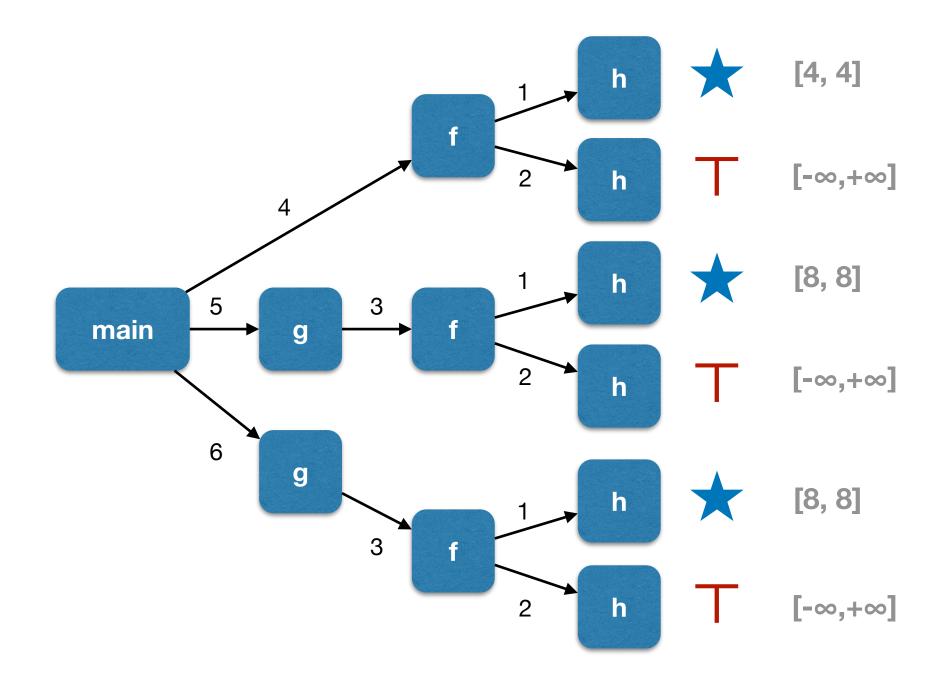

1. Collect queries whose expressions are assigned with *

```
int h(n) { return n; }

void f(s) {
   p = h(s);
   *(assert(p > 1);) // Q1: always true
   q = h(input());
   T assert(q > 1); // Q2: not always true
}

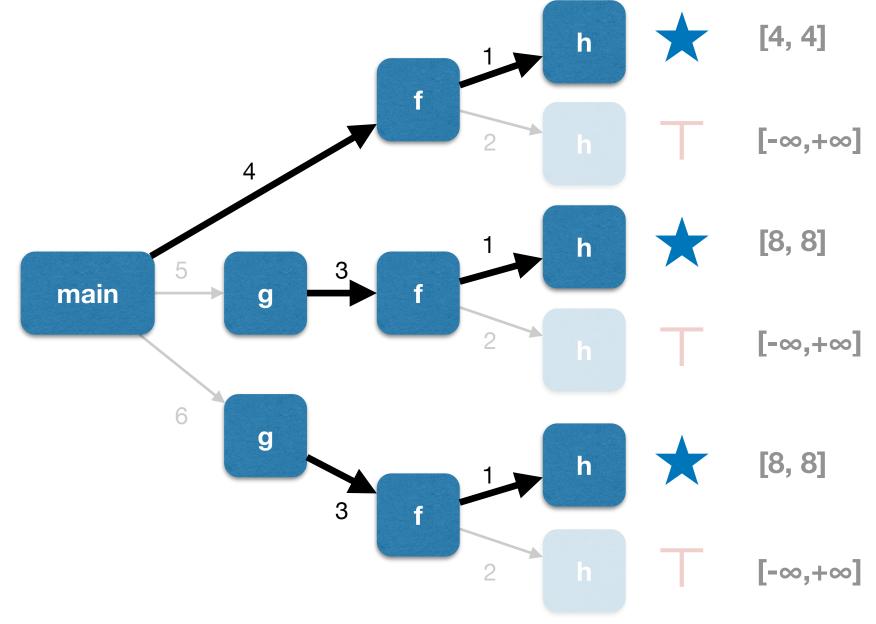

3: void g() { f(8); }

void main(){
   f(4);
   g();
   g();
}
```

Constructing Selective Sensitivity

2. Find contexts that contribute to the selected queries

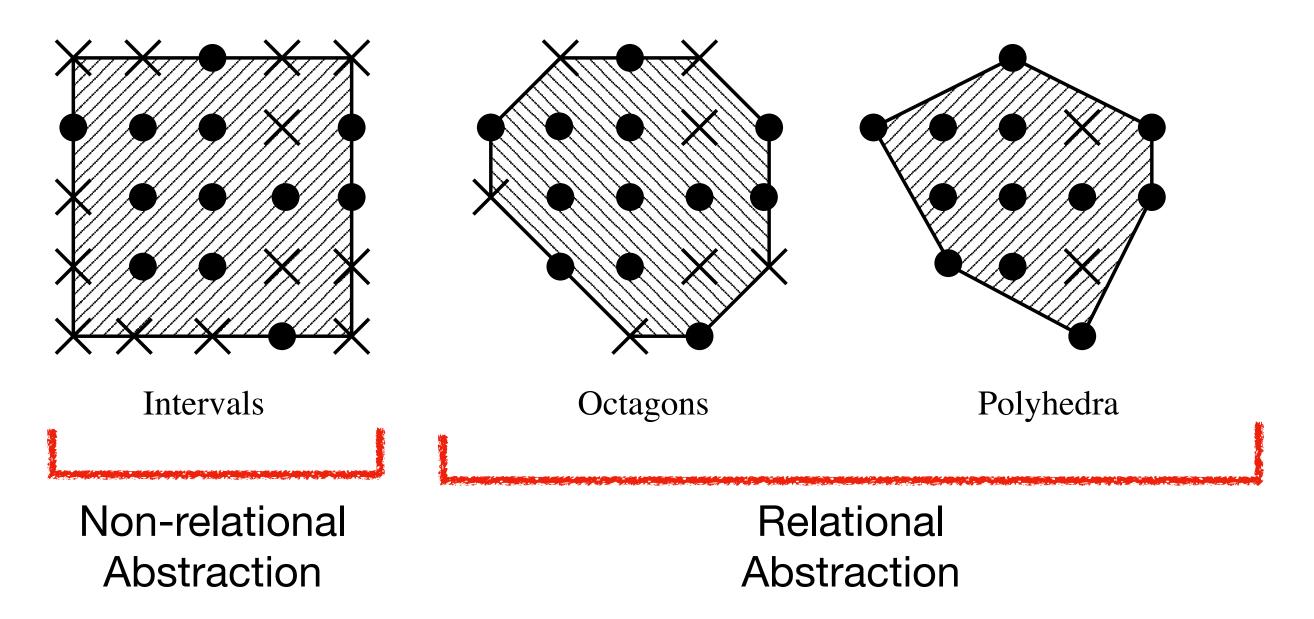

Selected contexts for function h: {4·1, 3·1}

Generality

- The same principle is applicable to other types of sensitivity
 - Running an impact pre-analysis
 (full X-sensitivity + aggressive abstraction of other aspects)
 - Select queries that are judged promising by the pre-analysis
 - Construct X-sensitivity that contributes to the selected queries

- Keep track of relationships between variables in a certain form
 - E.g., octagon analysis: $(\pm x) (\pm y) \le c$

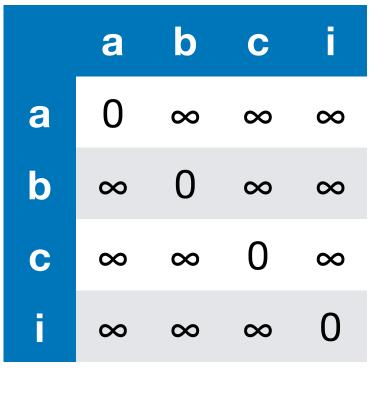

*A. Mine, The Octagon Abstract Domain, HOSC'06

Non-relational analysis with the interval domain

Var	Val
a	[-00, +00]
b	[-00, +00]
C	[-00, +00]
i	[0, +00]

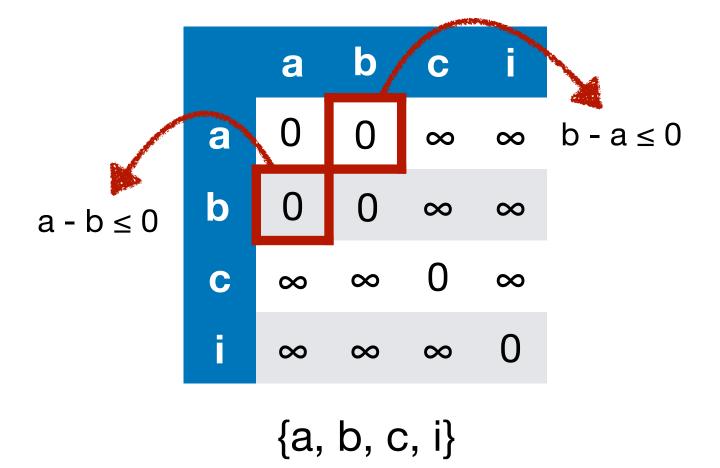

• Fully relational analysis with the octagon domain: $(\pm x) - (\pm y) \le c$

{a, b, c, i}

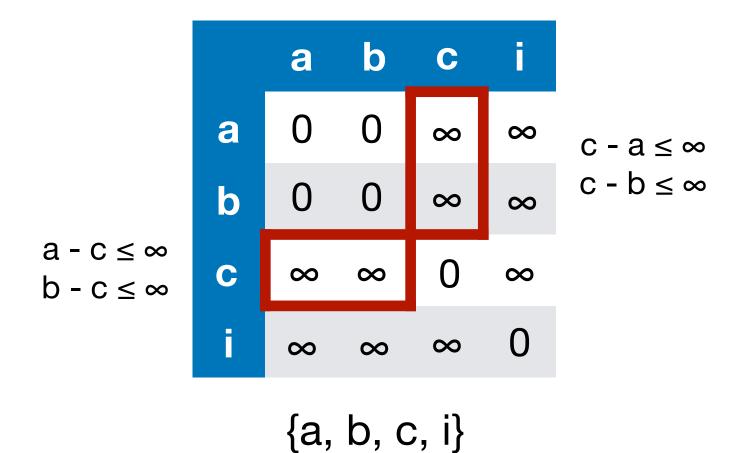

*Consider $x - y \le c$ only, for simplicity

• Fully relational analysis with the octagon domain: $(\pm x) - (\pm y) \le c$

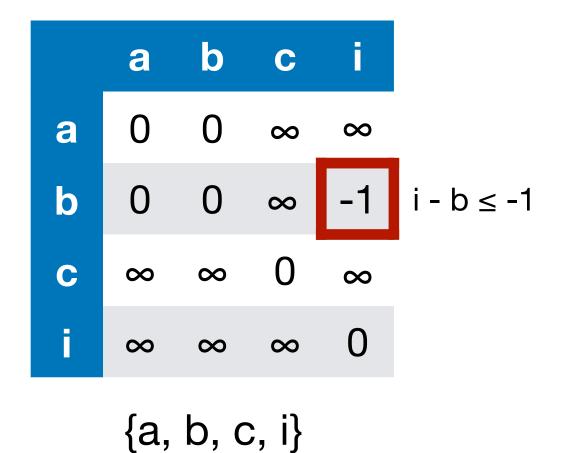

*Consider $x - y \le c$ only, for simplicity

• Fully relational analysis with the octagon domain: $(\pm x) - (\pm y) \le c$

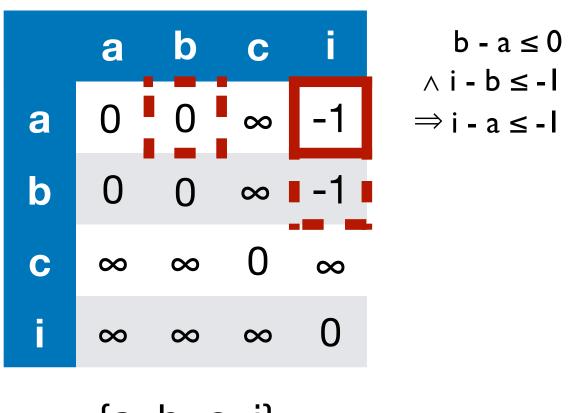

*Consider x - y \leq c only, for simplicity

• Fully relational analysis with the octagon domain: $(\pm x) - (\pm y) \le c$

*Consider $x - y \le c$ only, for simplicity

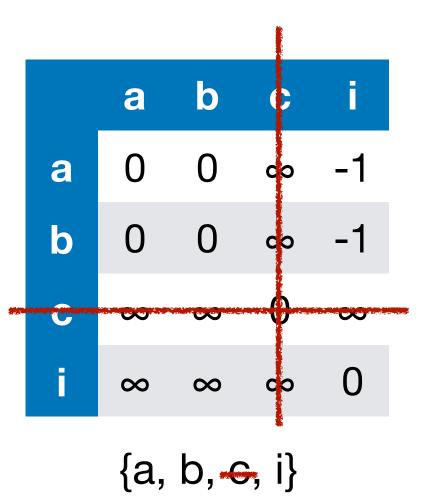

• Fully relational analysis with the octagon domain: $(\pm x) - (\pm y) \le c$

{a, b, c, i}

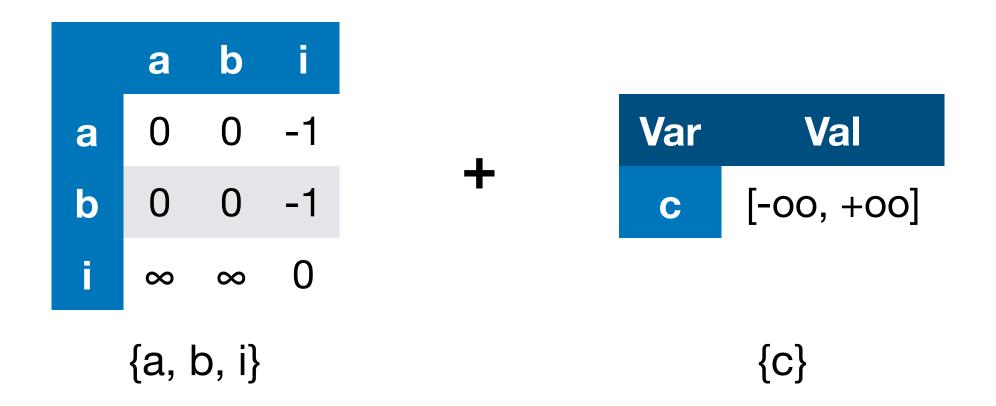

*Consider $x - y \le c$ only, for simplicity

• Problem of fully relational analysis: useless relationship

*Consider x - y \leq c only, for simplicity

• Solution: selective relational analysis

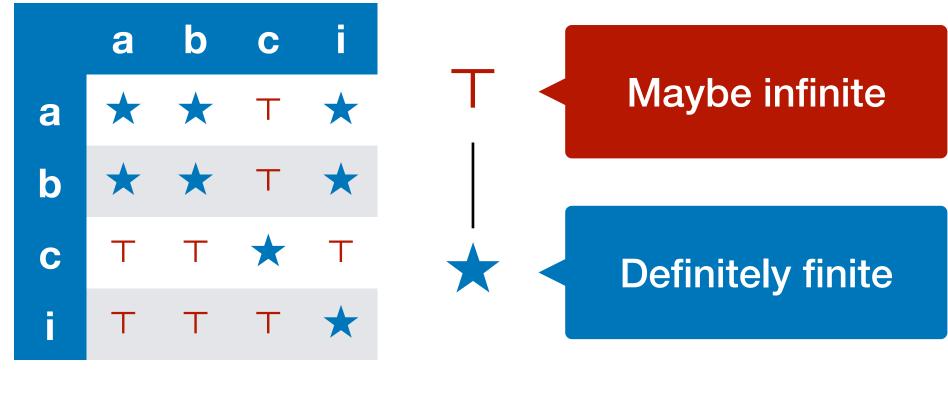

*Consider x - y \leq c only, for simplicity

Design of Impact Pre-Analysis

- Main analysis: non-relational analysis
- Impact pre-analysis: fully relational analysis + approximated upper bound

	a	b	C	i
а	0	0	∞	-1
b	0	0	∞	-1
C	∞	∞	0	∞
i	∞	∞	∞	0

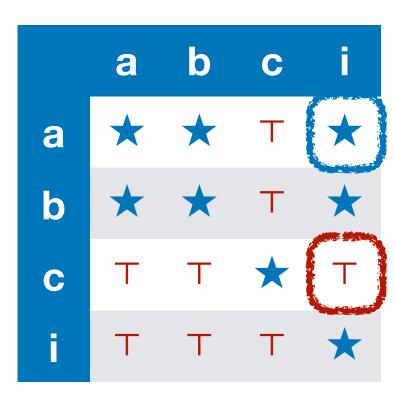

Fully relational octagon analysis

Fully relational impact pre-analysis

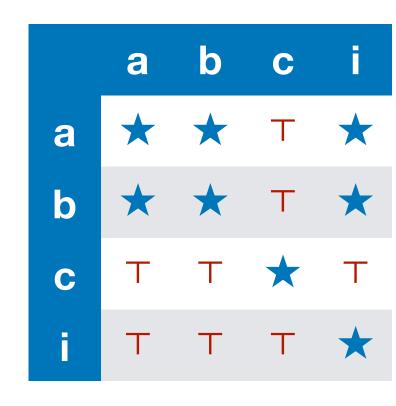

Constructing Selective Sensitivity

1. Collect queries whose expressions are assigned with *

Constructing Selective Sensitivity

2. Find variable relationships that contribute to the selected queries

Selected variables: {a, b, i}

Summary

- Selective X-sensitivity: a framework for balancing between cost & accuracy
- Key idea: "Apply X-sensitivity only when it matters"
- Estimate the impact of X using the impact pre-analysis
 - Full X-sensitivity + aggressive approximation of other precision aspects
- Construct selective X-sensitivity from the guidance of the impact estimation
